Summary

Full-stack software engineer with experience designing, building, and supporting production systems across the stack — from backend services and APIs to user-facing interfaces. Skilled in system design, performance optimization, debugging, and collaborating cross-functionally to ship reliable, maintainable software.

Education

Bachelor of Science, Computer Science
University of Washington Washington, USA
GPA: 3.5 |Dean's List (2 consecutive years)|
Computer Science Tutoring Club
2022- 2024

Projects

- **Ride-share App (Uber Clone) | React Native, Expo, Firebase (In Progress)**

Building a cross-platform mobile rideshare app for iOS and Android with real-time driver tracking, live location updates, and rider/driver matching via Firebase Realtime Database.

- **Appointment Scheduler | .NET Minimal API (C#), MySQL**

Designed a Calendly-style scheduling platform with availability logic, time-slot conflict detection, automated email confirmations, and personal calendar integration.

- **URL Shortener | Node.js, Express, MySQL, AWS**

Built a URL shortening service with collision-resistant hashing, CRUD operations, and concurrent write handling via an Express/MySQL backend deployed on AWS.

- **Church Management System | React, Firebase**

Built a full-stack church attendance and confession scheduling app using React and Firebase, with real-time sync across admin and member views.

- **Kitchen Menu Website | Square API**

Built a restaurant menu and ordering site integrated with the Square API for menu management, pricing, and order processing.

- **Battleship Game | JavaScript**

Built a two-player Battleship game with ship placement, turn-based hit/miss detection, and win condition logic.

- **Tunnel Pong: A 3D Unity Game**

Developed a fast-paced tunnel pong game featuring physics-based ball mechanics, procedurally generated obstacles, score tracking, and smooth player controls for an immersive cylindrical gameplay experience.

Skills

- **Languages:** C#, C++, JavaScript, TypeScript, SQL, HTML/CSS, Java
- **Frameworks & Libraries:** Unity, React, Node.js, Express, .NET (Minimal API), Firebase
- **Cloud & DevOps:** AWS, Google Cloud Platform (GCP), Docker, Git, CI/CD pipelines
- **Databases:** MySQL, Firebase
- **Tools & Methodologies:** Splunk, Jira, Agile, Test-Driven Development (TDD), Regex, REST APIs

Experience

Everett Community College I Full-Stack Web Developer

February 2024 – Present

- ·Gathered requirements from stakeholders and designed, implemented, and deployed a full-stack course registration system — building both the ColdFusion backend and the user-facing frontend — within an Agile environment, increasing peak-period registration throughput by 30%.
- ·Presented full-stack design and architecture proposals to tech leads, covering API contracts, data models, and UI/UX flows, and obtained approval before implementing new features. Built registration forms following accessibility best practices, including semantic HTML, proper labeling, and keyboard navigation.
- ·Refactored legacy ColdFusion backend modules and optimized frontend rendering using test-driven development (TDD), eliminating bottlenecks in data queries for the medical/nursing imaging database and cutting average system load and page load times by 50%.
- ·Reviewed full-stack code (frontend and backend) from other team members, providing feedback on code quality, style guidelines, and adherence to best practices.
- ·Monitored system health post-deployment using Splunk dashboards, identifying and resolving frontend and backend degradation issues proactively before they affected end users during high-traffic enrollment windows.
- ·Triaged full-stack product and system issues, debugging, tracking, and resolving them by analyzing root causes and their impact on hardware, network, and service operations and quality.

IT Support Analyst (started as Intern) I Zumiez

March 2022 - December 2024

- ·Identified a repetitive multi-step IT support process, proposed an automated solution to leadership, and built and got it approved for team-wide use — eliminating manual steps and reducing triage time on routine tickets by 30%.
- ·Wrote JavaScript automation scripts for recurring IT workflows, including account provisioning, device inventory syncing, and ticket pre-categorization.
- ·Built additional automation helper tools in C# to further streamline IT operations, consolidating repetitive multi-step processes into single-run scripts used across the support team.
- ·Trained and onboarded employees on internal tools and systems, improving team-wide adoption and reducing repeat support requests.
- ·Contributed to internal IT documentation, keeping support guides and onboarding materials up to date as tools and processes evolved.

Software Engineer (Volunteer) I Catena

January 2020 - September 2022

- ·Built backend text-processing pipelines in C# that merged, normalized, and aligned Bible texts and commentary across multiple sources, using regex-driven parsers to handle inconsistent source formatting and unify parallel passages into a single data model.
- ·Refactored legacy text-processing code and optimized regex performance, reducing data preparation time by 40% and improving search and lookup responsiveness across iOS and Android.
- ·Shipped multi-language text support with careful Unicode handling and locale-aware backend logic, expanding the user base to 20,000+ new international users.
- ·Collaborated with designers and product managers on advanced search and annotation features, increasing average session interaction depth by 25% based on telemetry data.
